

Bill Dingwall (center) of the WWLT leads the group in tree identification.

Here the group learns about a “**muscle tree**” also known as a form of **Beech**.

We learn that **earthworms** are quite active and abundant on the island which may also be why we don't have a lot of new growth. An invasive species, they can prevent seeds from germinating.

Pairing off, one led while the other followed with eyes closed. The “blind” person was led to a tree to come to terms with and were then led away and asked to see if they could identify that tree once they opened their eyes again.

Ray Krolak helps Don Kissinger find his way.

Lots of new flowers were growing on the forest floor.

Pilled woodpeckers have made short work of this tree stump.

Leave it to the kids to find the bugs....

There is a small, hidden **wetlands** on the north side of the island. WWLT's Rick Gauger (far left) photos for prosperity.

Bill Dingwall leads the trek back to the south end of the island.

Blueberry patches are quite abundant on the south side of the island.
